(PATENT)

AMENDMENTS TO THE CLAIMS

Listing of Claims:

- 1. (Currently Amended) A micropump, comprising a body of semiconductor material, characterized by a plurality of fluid-tight chambers, selectively openable, formed within said body and having a preset internal pressure different from atmospheric pressure.
- 2. (Original) The micropump according to claim 1, characterized in that said fluid-tight chambers are sealed by at least one diaphragm, openable electrically.
- 3. (Original) The micropump according to claim 2, characterized in that said diaphragm is a dielectric material layer.
- 4. (Original) The micropump according to claim 3, characterized in that said diaphragm is of silicon dioxide.
- 5. (Original) The micropump according to claim 4, characterized in that said diaphragm has a thickness not greater than 1 μ m.
- 6. (Original) The micropump according to claim 2, characterized by a conductive diaphragm for each fluid-tight chamber.
- 7. (Original) The micropump according to claim 6, characterized in that each said diaphragm comprises a respective electrode having a preferential melting point near an inlet of a respective fluid-tight chamber.
- 8. (Currently Amended) The micropump according to any of claims 2 to claim 6, characterized by electrical-opening means for opening said diaphragm.
- 9. (Original) The micropump according to claim 8, characterized in that said electrical-opening means comprise at least one first electrode and, for each fluid-tight chamber, a respective second electrode, said diaphragm being arranged between said first electrode and a respective one of said second electrodes near an inlet of each said fluid-tight chamber.
- 10. (Original) The micropump according to claim 9, characterized by a first voltage source, connectable to said first electrode of said micropump and supplying a first voltage (V1), and a second voltage source, selectively connectable to one of said second electrodes of said micropump and supplying a second voltage (V2).

(PATENT)

11. (Original) The micropump according to claim 8, characterized in that said electrical-opening means comprises a current source, selectively connectable to one of said electrodes and supplying a current (I) that melts said electrodes.

- 12. (Withdrawn) A process for manufacturing a vacuum micropump, comprising the steps of:
 - a) forming cavities in a substrate of a wafer of semiconductor material; and
 - b) sealing said cavities at a preset pressure.
- 13. (Withdrawn) The process according to claim 12, wherein said step of forming cavities comprises the steps of:
 - a) forming, on top of said substrate, a mask having sets of openings;
 - b) etching said substrate through said sets of openings;
- c) coating exposed portions of said mask with a first layer of said semiconductor material; and
 - d) thermally oxidizing said first layer so as to close said first sets of openings.
- 14. (Withdrawn) The process according to claim 13, comprising the steps of:
 - a) growing an epitaxial layer on said mask;
 - b) depositing at least one conductive line on top of said epitaxial layer; and
 - c) etching said conductive line and said epitaxial layer until said cavities are reached.
- 15. (Withdrawn) The process according to claim 13, wherein said step of sealing comprises depositing a second layer of dielectric material at controlled pressure.
- 16. (Withdrawn) The process according to claim 15, wherein said second layer is of silicon dioxide.
- 17. (Withdrawn) The process according to claim 16, in which said second layer has a thickness not greater than 1 μ m.
- 18. (Withdrawn) A method of amplification, comprising amplifying a target nucleic acid in an integrated microfluidic reactor, wherein a fluid comprising the target nucleic acid is moved through the microfluidic reactor using the micropump of any of claims 1- claim 11.
- 19. (Withdrawn) A method of biological analysis, comprising analyzing a target biological molecule in an integrated microfluidic reactor, wherein a fluid comprising the target biological

(PATENT)

molecule is moved through the microfluidic reactor using the micropump of any of claims 1-claim 11.

- 20. (New) A microfluidic device comprising:
 - a) a microfluidic circuit; and
- b) a micropump, for moving a fluid through the microfluidic circuit, wherein the micropump comprises a body of semiconductor material, and a plurality of fluid-tight chambers, selectively openable, formed within said body and having internally a preset pressure and wherein a pressure differential is present between the fluid-tight chambers and the microfluidic circuit.
